***“Sweeping Away The Competition...”***

### **White Paper on Load Building**

Pack a Truck with QAD®? Can't be done, right? Wrong. LoadBuilding is a seamlessly integrated module for QAD that allows users to manage an entire order rather than line by line. Weights, pallets, and cube measurements all facilitate the management of loading trucks and customer orders.

#### **Key Functionality**

- Mix-mode shipping of customer orders and drp orders on the same truck.
- Manage an order as a whole: change due dates, shipping sites, etc., once and have it affect all lines on the order.
- Resource an order to another shipping site and check for available inventory.
- Seamless integration of drp orders and sales orders allowing shipping to better manage the warehouse.
- Enhanced DRP facility that allows for the creation of intersite requests and DRP orders in one step. Additionally, the facility will create the orders based on weight restrictions and pallet sizes.
- Track shipment cuts by reason code for service level reporting.
- Track order entry cuts by reason code for efficiency reporting.
- Attach multiple orders and multiple ship-to's to a single truck. This makes the truck a distribution entity. Shipment confirmation is completed by the truckload.
- Ability to reprint picklists for sales orders and DRP orders.
- Ability to maintain and track appointment times for carriers and loads and print appointment schedules.

**Simplify your distribution process with LoadBuilding and your efficiencies will Improve!!!**
